

SYSTEM AND METHOD FOR PROVIDING FEEDBACK TO AN INDIVIDUAL PATIENT FOR AUTOMATED REMOTE PATIENT CARE

Abstract

A system for providing feedback to an individual patient for automated
5 remote patient care is presented. A medical device having a sensor for monitoring
physiological measures of an individual patient regularly records a set of
measures. A remote client processes voice feedback into a set of quality of life
measures relating to patient self-assessment indicators. A database collects the
collected measures set, the identified collected device measures set and the quality
10 of life measures set into a patient care record for the individual patient. A server
periodically receives the identified collected device measures set and the quality
of life measures set from the medical device, and analyzes the identified collected
device measures set, the quality of life measures set, and the collected device
measures sets in the patient care record relative to other collected device measures
15 sets stored in the database to determine a patient status indicator.
